Subject: Area 40 Ambient Air Results - November 2017
Attachments: Fig04_Proposed_Ambient_Monitoring_Locations.pdf; September Event Results.pdf

Hi Everyone – We are still working on the summary report; however, we wanted to ensure you had time to review the TCE results for the Area 40 ambient air investigation conducted during November prior to our January 16th meeting. Attached is a map of the sample locations and the TCE concentrations detected in the November 2017 samples. I have also attached the figure from the September summary report that shows the TCE results. TCE concentrations have declined from hot summer days to cold fall days. Only one location (-02) contained TCE at a concentration above the indoor air screening value. While locations -01, -02, -05, and -08 continue to have detections of TCE, several locations where TCE was detected during the September event did not contain TCE during the November event (-04, -10, -11, -21, -24, -25, and -27). None of the samples collected from locations along the northern property boundary contained TCE at detectable concentrations.

We can discuss further during the January 16 meeting. Chris
